Assignment 00

Question 2 answer:

When I run git stash after changing a file, it saves my uncommitted work and resets the folder back to the last commit. In git log --all --oneline I can see the stash listed as something like stash@{0} along with the normal commits. When I use git stash pop, my changes come back. This is useful if I need to switch branches or pull updates but don't want to commit unfinished work yet.
